

## Supplementary materials

**Table 1.** Summary of studies included.

| <b>Author/year/country</b>                         | <b>Study design</b>               | <b>Objective</b>  | <b>Key findings</b>  |
|--|-----------------------------------|---|--|
| <b>Santus et al. 2023;<br/>Italy<sup>7</sup></b>   | Narrative clinical review         | Summarise acute dyspnoea pathophysiology and the role of LUS for early diagnosis/management.                                    | Early recognition of respiratory failure is critical; LUS shows high diagnostic accuracy and sensitivity for acute dyspnoea syndromes. |
| <b>Schoeneck et al., 2021; USA<sup>4</sup></b>     | Observational study               | To assess feasibility and diagnostic performance of pre-hospital thoracic ultrasound (B-lines) for dyspnoea , particularly AHF. | Prehospital B-line assessment by trained paramedics is feasible and yields high sensitivity/specificity for AHF.                       |
| <b>Arvig et al., 2023;<br/>Denmark<sup>8</sup></b> | Randomised controlled trial (RCT) | To determine whether serial cardiopulmonary POCUS plus usual care reduces acute dyspnoea severity vs usual care alone.          | Serial POCUS with usual care significantly reduces dyspnoea severity, supporting routine use for faster stabilisation.                 |

|  |                                |  |  |
|--|--------------------------------|--|--|
| <b>Beyer et al., 2021; USA<sup>9</sup></b>         | Prospective multicentre cohort | To evaluate whether POCUS reduces diagnostic uncertainty in dyspnoeic patients when performed by emergency physicians without a dedicated ultrasound team. | POCUS provides immediate diagnostic information, narrows differentials, and is effective even without a specialised ultrasound team.           |
| <b>Kowalczyk et al., 2023; Poland<sup>10</sup></b> | Review                         | To review LUS techniques/protocols and its utility for differential diagnosis of dyspnoea.   | LUS demonstrates high sensitivity/specificity for dyspnoeaetiologies and is suitable for pre-hospital use to enable early, targeted treatment. |
| <b>Zare et al., 2022; Irann<sup>11</sup></b>       | Randomised controlled trial    | To evaluate the effectiveness of bedside thoracic ultrasound by emergency physicians for undifferentiated acute dyspnoea.                                  | Early thoracic ultrasound in the ED increases diagnostic accuracy and reduces turnaround time.   |
| <b>Farahmand et al., 2020; Iran<sup>12</sup></b>   | Diagnostic accuracy study      | To compare cardiac, thoracic, and inferior vena cava (IVC) ultrasound—alone or combined—for acute decompensated heart failure.                             | The combination of thoracic, cardiac, and IVC ultrasound yields high diagnostic accuracy for acute decompensated heart failure.                |
| <b>Kok et al., 2022; Netherlands<sup>13</sup></b>  | Review                         | To assess effectiveness/efficiency of POCUS for  | POCUS improves diagnostic accuracy in dyspnoea, non-   |

|   |                                 |  |   |
|---|---------------------------------|--|---|
|   |                                 | respiratory and circulatory emergencies.   | traumatic hypotension, and shock, accelerating treatment; more feasible/rapid than alternative imaging in acute settings.   |
| <b>Glöckner et al., 2020; Germany<sup>14</sup></b>  | Prospective single-centre study | To evaluate POCUS accuracy (B-lines) for diagnosis and short-term monitoring in acute dyspnoea due to AHF.               | LUS is useful for early AHF diagnosis but has limited value for exclusion; minimal change observed at 24–72 h monitoring.   |
| <b>Nakao et al., 2021; Canada<sup>15</sup></b>      | Cohort study                    | To compare diagnostic accuracy of LUS vs chest radiography for AHF in dyspnoeic ED patients.                             | LUS by emergency physicians shows high sensitivity (~92.5%) and good specificity, outperforming chest radiography (~63.6%). |
| <b>Bouzidi et al., 2025; Tunisia<sup>16</sup></b>   | Review                          | To evaluate accuracy of LUS combined with clinical assessment vs traditional diagnostic pathways for AHF in ED dyspnoea. | LUS is excellent for ruling in/out AHF; systematic use is recommended in ED pathways.                                       |
| <b>Ienghong et al., 2024; Thailand<sup>17</sup></b> | Cross-sectional study           | To determine characteristics and diagnostic accuracy of prehospital ultrasound using portable devices.                   | Prehospital POCUS can be implemented effectively; field diagnoses correlate well with in-hospital diagnoses.                |
| <b>Fitzgerald et al., 2024; USA<sup>18</sup></b>    | Prospective pre–post study      | To test whether a brief thoracic POCUS   | Focused paramedic education for   |

|   |   |   |  |
|---|---|---|--|
|   |   | training improves pre-hospital diagnostic accuracy and treatment plans for COPD/AHF exacerbations.  | undifferentiated respiratory distress and thoracic ultrasound interpretation improves treatment planning.  |
| <b>Vauthier et al., 2021; France<sup>19</sup></b>   | Prospective study                               | To assess LUS utility for AHF diagnosis and evaluate a POCUS-based algorithm in acute dyspnoea.   | In 103 adults, POCUS LUS and its algorithm perform excellently for acute dyspnoea evaluation.  |
| <b>Gundersen et al., 2023; Denmark<sup>20</sup></b> | Prospective observational study                 | To examine whether POCUS improves diagnostic accuracy for dyspnoea aetiologies (including AHF), given that uncertainty relates to worse outcomes. | Supplemental pre-hospital POCUS improves overall diagnostic accuracy; sensitivity remains modest, but tailored use optimises rule-in/rule-out for AHF. |
| <b>Russel et al., 2024; USA<sup>21</sup></b>        | Prospective non-randomised interventional study | To compare paramedic diagnostic accuracy for AHF with vs without LUS in prehospital dyspnoea, and assess impact on therapy initiation.            | LUS improves pre-hospital AHF sensitivity/accuracy and increases rates while reducing time to initiation of AHF therapy.                               |
