

inpatient wards shows that the majority have good patient identification implementation. There is Relationship between level knowledge with application identification patient in Inpatient Ward. There is no Relationship between workload nurse with application identification patient in Inpatient Ward. It is hoped that the results of this research can become a strong basis or reference for future research. Suggestions from researchers are expected to not only examine the level of knowledge and workload but also to research factors that can influence the implementation of patient identification and other patient safety targets.

Suggestions

The results of this study are expected to be a strong basis or reference for future research. Suggestions from researchers are expected to not only examine the level of knowledge and workload but also be able to research the factors that can affect the application of patient identification and other patient safety goals. The results of this study are expected to be information and data materials for hospitals to be able to further improve programs regarding patient safety to improve nurse knowledge. It is hoped that the results of this research can become a strong basis or reference for future research.
